

ImageGallery

Inspiration:

Now a days every user has tons of images in their phones and will always look for better app which can help them to view their images easily and even share with one touch by improving user experience. Android gridview provides such platform where users can view multiple images in gridview at once and can do operations like Copy, Delete and Share with one touch. This kind of apps are always important to improve user experience and would like to propose an app which does all of it.

Goal:

App will access all images in Camera folder from internal storage and display them in grid view. User can select any image from grid view list to view image in fullscreen in separate page with three options Cancel, Copy and Delete. Cancel will help users to navigate back to previous page without any changes. Delete will pop up an alert and if user selected yes then it will remove image from camera folder. Copy will pop up folder names present in internal storage (bluetooth, download and pictures folders) and user can select one of them to copy image. Once user picked the folder, image will copied into respective folder.

Intended Audience:

This app is intended to all mobile users including students, professionals, business people etc. It is simple and easy to use so kids can enjoy too without any problems.

Calculations:

No calculations required for this app as of now.

Future work:

If time permits, will include an option to Share which can have different options like sharing via Bluetooth or whatsapp or any other social network app. First i will try to implement Whatsapp sharing and then rest based on time.

Design:
