Inspiration:

Many people have smartphones but they are not sure what places are there around them. I have created an app which helps user to explore places nearby and they can even check places nearby to any location (used zip code to identify location). Now finding restaurant or gas station nearby is not difficult.

Goal:

App will get current device location and shows the same with marker and GPS icon in google map present in it. Users can explore places nearby like atm, gas stations, restaurants, schools, hospitals, grocery shops etc with help of this app. Based on user query, presented information using google places API's. Users can see places markers in the map and get the same details in the list view as well. Information in list view has distance from current location, place name with address and availability status. Provided an option to update the location with help of zip code so that users can explore any places not just around them.

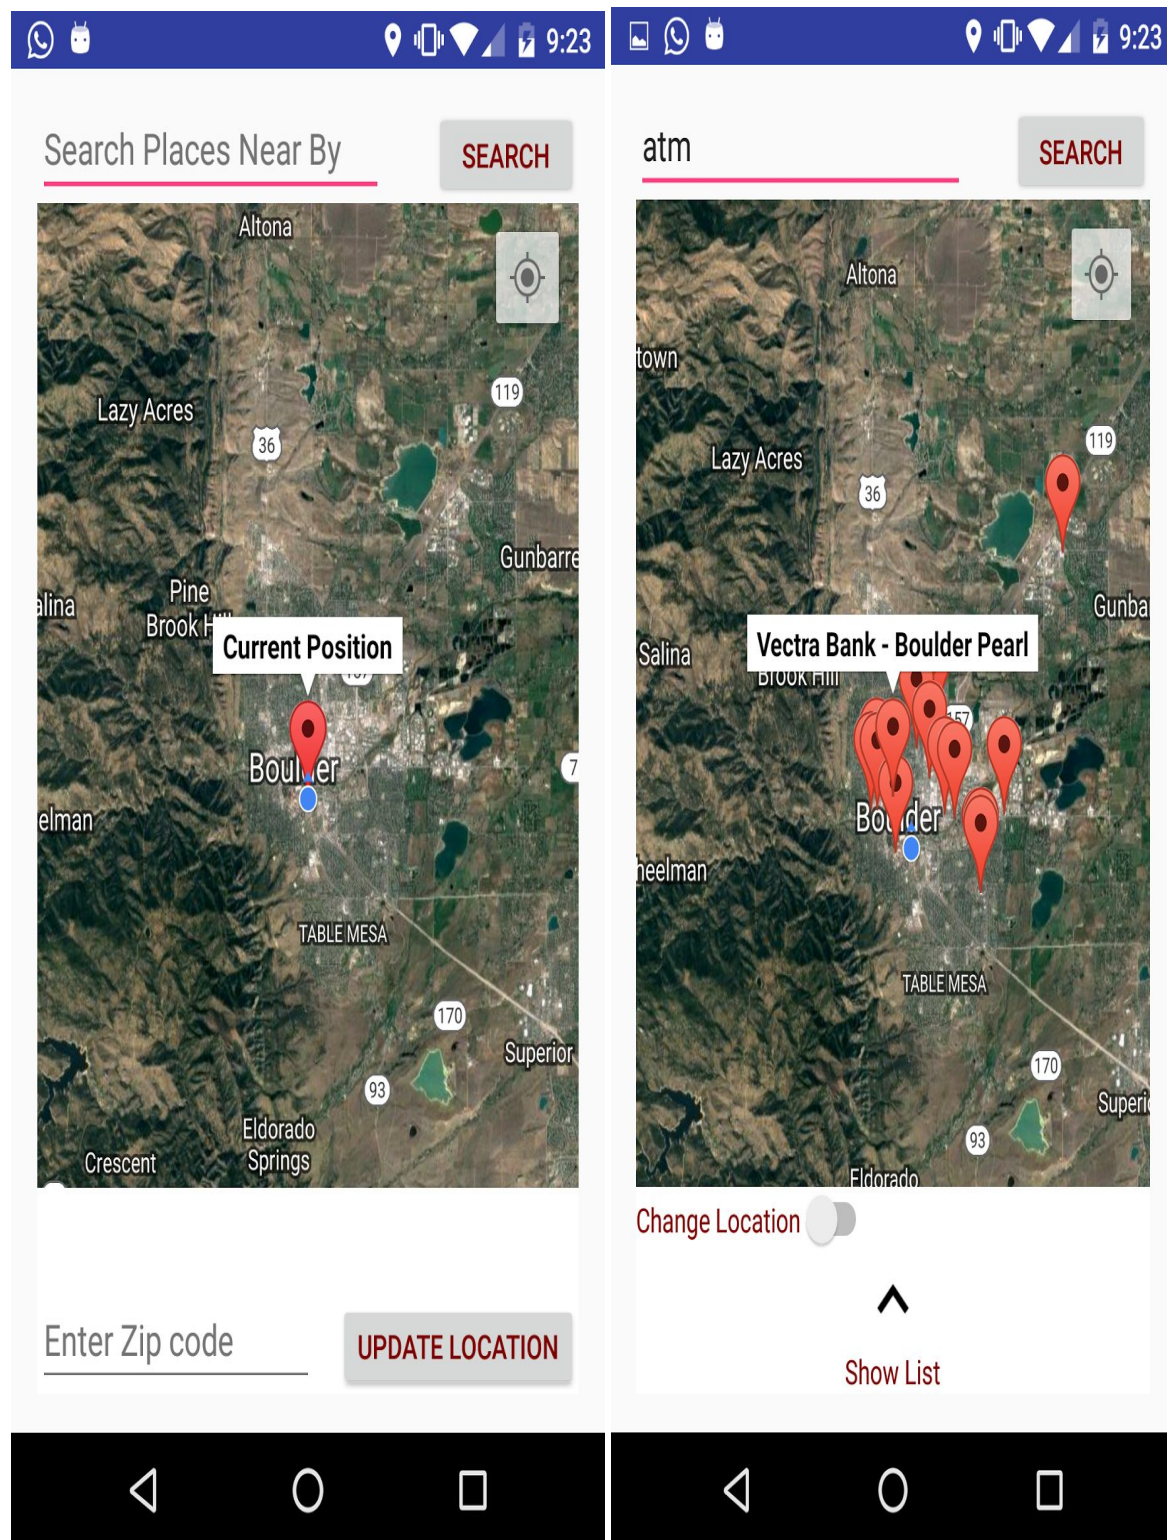

Intended Audience:

This app is intended to all mobile users including students, professionals, business people etc. It is simple and easy to use so kids can enjoy too without any problems.

Calculations:

No calculations required for this app as of now.
